

Introducing Metasys Release 13.0 by Johnson Controls

Make the most of building investments with a secure,
modern platform

The newest Metasys release expands access to its world-class user interface, offering clear modernization paths while enhancing UI and display capabilities, increasing cybersecurity safeguards and streamlining integrations with a new BACnet/IP router and Modbus gateway.

The power behind **your mission**

Exciting new features and enhancements

World-class Metasys interface

The world-class Metasys interface is now available on Metasys SNx series network engines, giving “engine only” customers a scalable path to upgrade the legacy Site Management Portal, which has entered restricted end-of-support. Operator efficiency is also maximized with these UI enhancements:

- Logic viewer clearly indicates command priority to reduce time spent troubleshooting
- Alarm notification bar shows pending alarms, helping the logged-on user identify, troubleshoot and resolve issues quickly
- Additional reporting and trend data enable users to view and save data for future improvements

With the phaseout of aging Metasys components like SMP, you can't afford an out-of-date Metasys system. Johnson Controls is committed to working with you on an upgrade strategy that fits your installation and budget. Talk to our Metasys experts today about modernizing your BAS.

Universal Johnson Controls router and gateway

A new BACnet/IP router and Modbus gateway streamline integrations and reduce costs. Benefits include:

- Integration of third-party Modbus equipment into the BAS
- Support for up to 32 devices
- No need for a dedicated Metasys engine

New display features

Local controller, CG controller and network engine display models improve field productivity with these new features:

- Save time with plug-and-play functionality—out-of-the-box displays require no configuration
- View trend data in tabular format
- Use Live Trend to plot the present value of up to two un-trended application points in real time
